INSTANT CENTERS OF VELOCITY

(Section 6.4 in Norton) Instant Center - denotes the center of rotation of a body at an instant in time. The center of rotation doesn't necessarily have to lie within the link itself. 1. It is a point in one body about which some other body is permanently or instantaneously rotating about. 2.

This point is called the instantaneous center (IC) of zero velocity. It may or may not lie on the body! If the location of this point can be determined, the velocity analysis can be simplified because the body appears to rotate about this point at that instant.

INSTANTANEOUS CENTER OF ZERO VELOCITY

INSTANTANEOUS CENTER OF ZERO VELOCITY (Section 16-6) For any body undergoing planar motion, there always exists a point in the plane of motion at which the velocity is instantaneously zero (if it is rigidly connected to the body). This point is called the instantaneous center (IC) of zero velocity. It may or may not lie on the body!

INSTANTANEOUS CENTER OF ZERO VELOCITY

The instant center is an imaginary point that allows for a mathematical "shortcut" in calculating these unknowns. The instant center is also called the instantaneous center of zero velocity (IC). It lies on an imaginary axis of zero velocity, about which the

RELATIVE MOTION ANALYSIS: VELOCITY

$\frac{3}{4}$ A point of a rigid body whose velocity is zero at a given instant is called instantaneous center.

Mechanism: $\frac{3}{4}$ A point, common to two bodies (links) in a plane, which point has the same instantaneous velocity in each link.

AME 352 GRAPHICAL VELOCITY ANALYSIS

The instant center of rotation, also called instantaneous velocity center, or also instantaneous center or instant center, is the point fixed to a body undergoing planar movement that has zero velocity at a particular instant of time. At this instant, the velocity vectors of the trajectories of other points in the body generate a circular field around this point which is identical to what is generated by a pure rotation.

Instantaneous Center of Velocity (ICV): Any point on a rigid body or on its extension that has zero velocity is called the Instantaneous Center of Velocity of the body. Assuming one knows the ICV of a body, one can calculate the velocity of any point A on the body using the equation and recognizing that by definition .
